

Managing Existing Modules

Two main actions are available for each configured module:

1. **"Edit" button:** provides access to the configuration wizard to modify the existing configuration. This function allows you to:
 - Update fields to be exported
 - Modify filters and selection criteria
 - Change formatting options
 - Adjust the module's export logic
2. **"DELETE" button:** permanently removes the selected configuration. To ensure data security, the system implements a confirmation procedure that:
 - Displays a warning message before deletion
 - Requires explicit user confirmation

This prevents accidental deletions and informs that already exported CSV files will be removed.
